

PAINTED STEEL WORK SURFACES

POWDER COATED STEEL SURFACES:

Our steel work-surface is protected by one of the newest paint application methods in the industry. Powder coated steel is a chemical resistant, baked coating that is able to withstand a number of chemicals. However, in order to prolong the “like new” appearance of your installation, it is necessary to regularly clean all exposed surfaces.

Regular cleaning

Powder coated steel needs to be cleaned regularly to remove surface contaminants. This also helps to safeguard against unwanted chemical reactions. The best method for cleaning is to use glass cleaner with a soft cloth. Be sure that this cleaner is compatible with other chemicals that may be in use around the area you are cleaning as ammonia based products should never be mixed with products containing bleach.

Caution:

- **Do not** use steel wool or abrasive cleaners for cleaning. This may damage the surface.
- **Do not** expose powder coated surfaces to acids which may cause staining or damage to the exposed surface(s).

Chemicals to Avoid:

- EK (Methyl Ethyl Keytone), Acetone, or other strong solvents
- Chlorine-based cleaners
- Sulfur-based cleaners
